# Quantum Science & Quantum Computing

**Silvia Zorzetti**

How the smallest rules of nature can change our world

U.S. DEPARTMENT  
of **ENERGY**

Fermi National Accelerator Laboratory is managed by  
FermiForward for the U.S. Department of Energy Office of Science

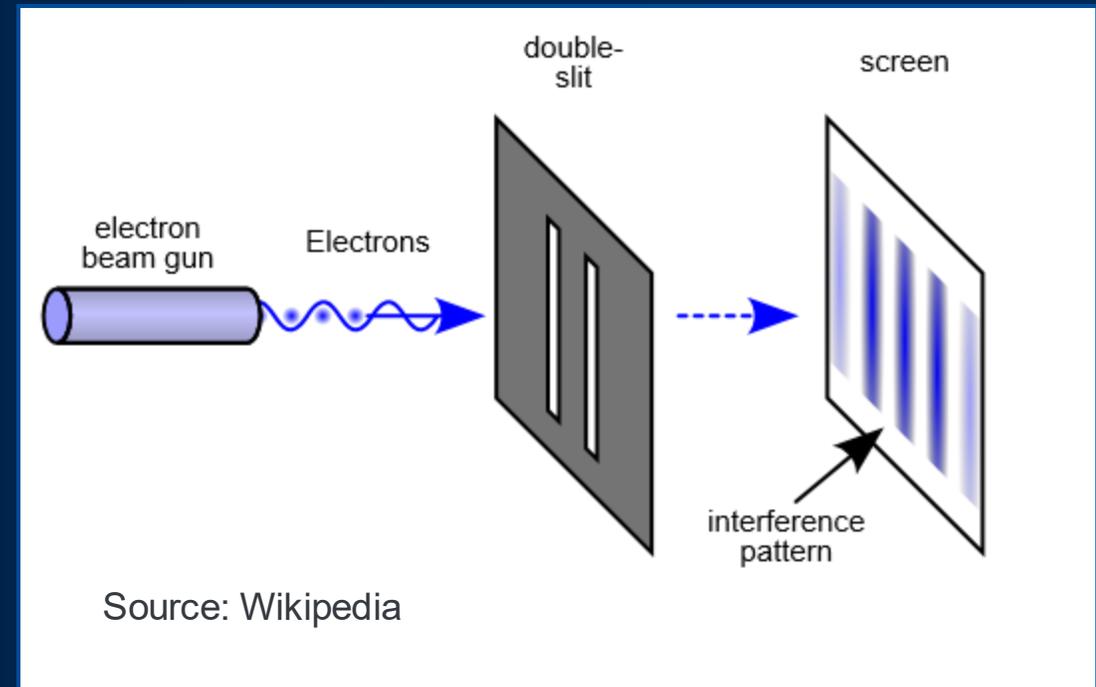

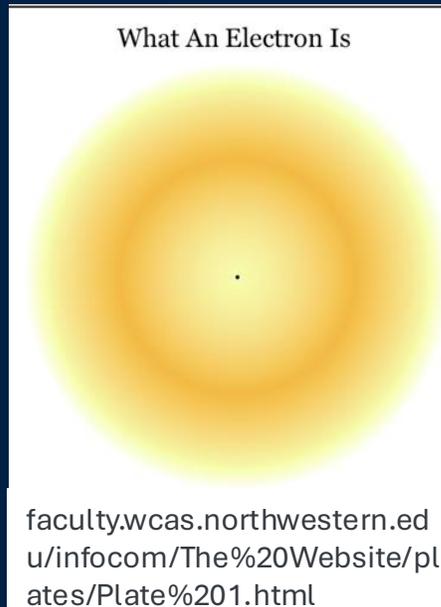

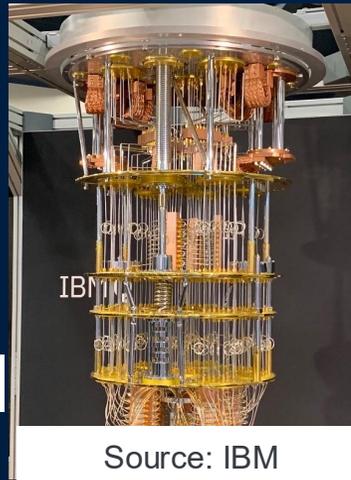

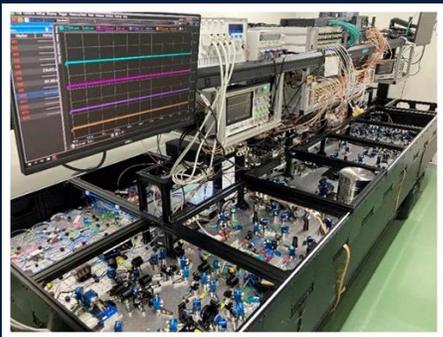

01

The world is excited about quantum

# Why are people excited about Quantum

Quantum science helps us:

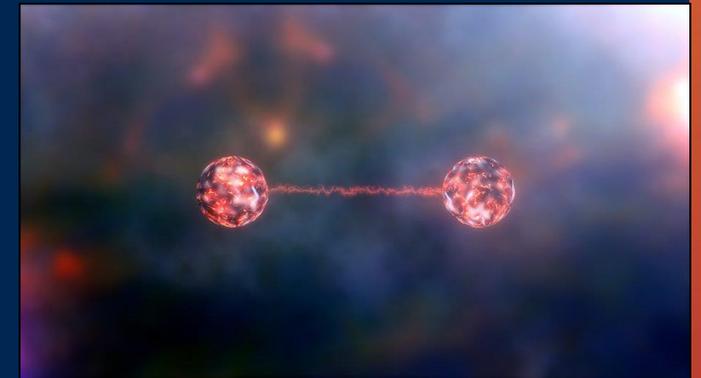

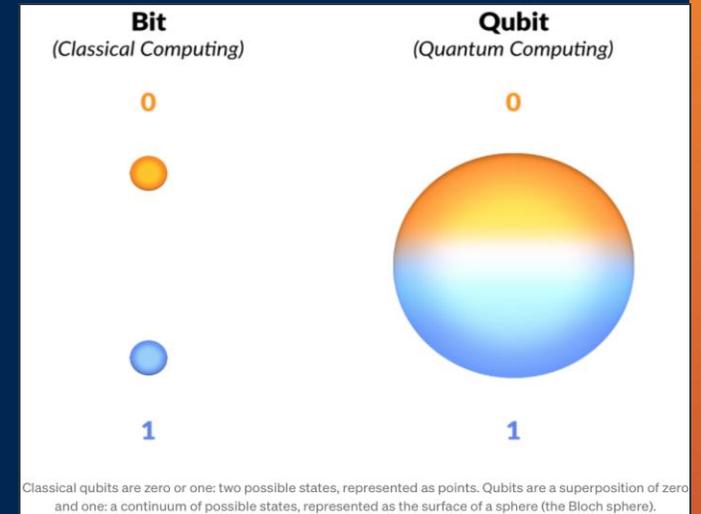

- Understand how Nature works at the smallest scales
- Build new technologies that were impossible before
- Ask and answer new kinds of questions
- Bring together physics, math, computer science, and engineering

# Quantum Information Science

- A growing field in science and technology that combines and draws from the disciplines of physics, mathematics, computer science, and engineering.
- The goal is to understand how some fundamental laws of quantum physics—superposition, entanglement—can be exploited to drastically improve the acquisition, transmission, and processing of information and data.
- The exciting scientific opportunities offered by QIS are attracting the interest of a growing community of scientists and technologists, fostering unprecedented interactions beyond traditional disciplinary boundaries.

# Quantum science is confusing

... and physicists seem to be ok with that!

- “I think I can safely say that nobody really understands quantum mechanics,” observed the physicist and Nobel laureate Richard Feynman.
- Quantum mechanics has a reputation for being especially mysterious.
- What’s surprising is that physicists seem to be O.K. with not understanding the most important theory they have.

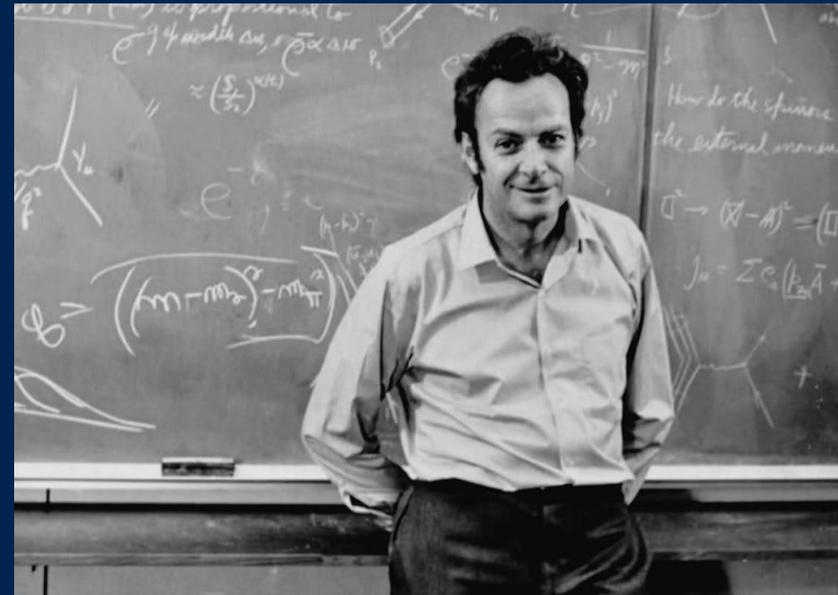

The New York Times | <https://www.nytimes.com/2019/09/07/opinion/sunday/quantum-physics.html>

## Even Physicists Don't Understand Quantum Mechanics

Worse, they don't seem to want to understand it.

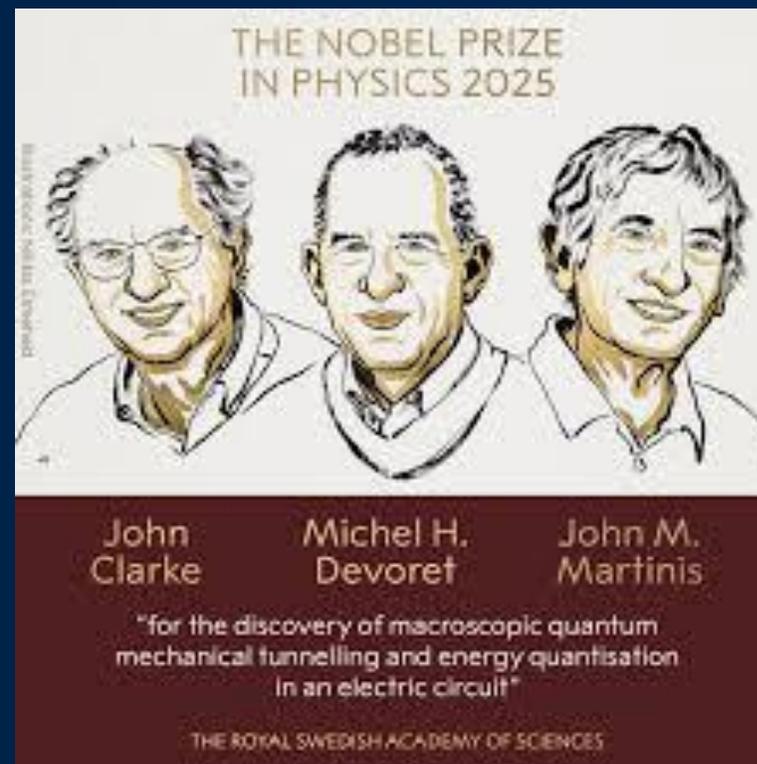

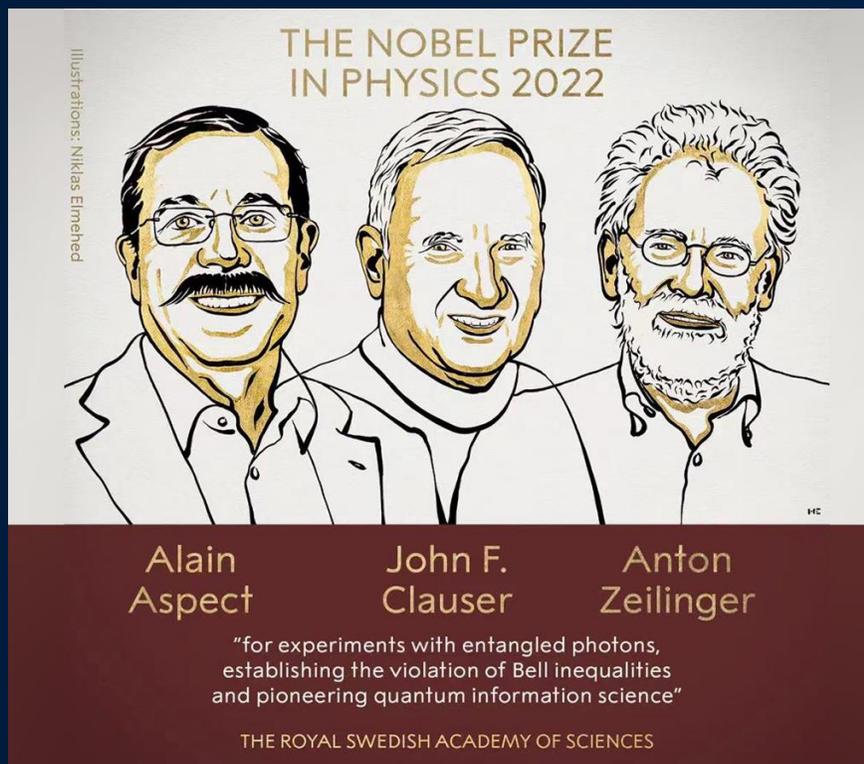

Sept. 7, 2019

By Sean Carroll  
Dr. Carroll is a physicist.

# The world is excited about QIS

- Nobel prize in physics 2022
- Nobel prize in physics 2025

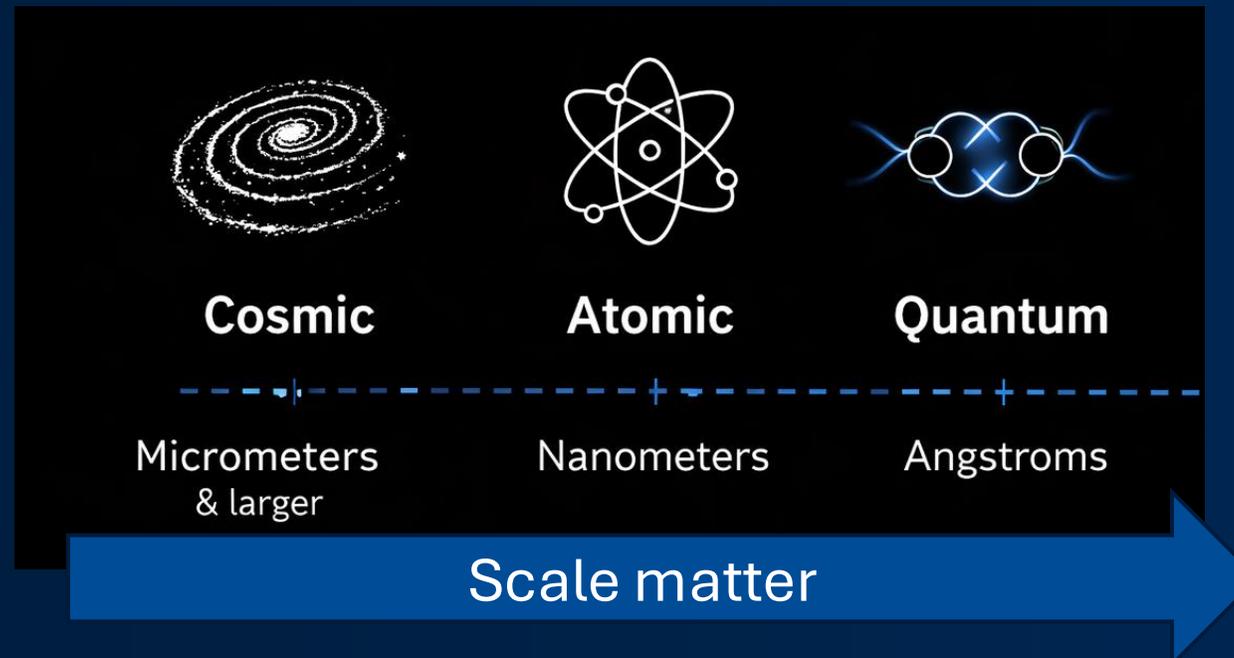

# The world we see vs. the quantum world

## Everyday world

- Objects have clear positions
- Things behave predictably
- Classical physics works well

## Quantum world

- Particles act like waves
- Outcomes are probabilistic
- Quantum physics is needed

# From quantum mechanics to quantum computing

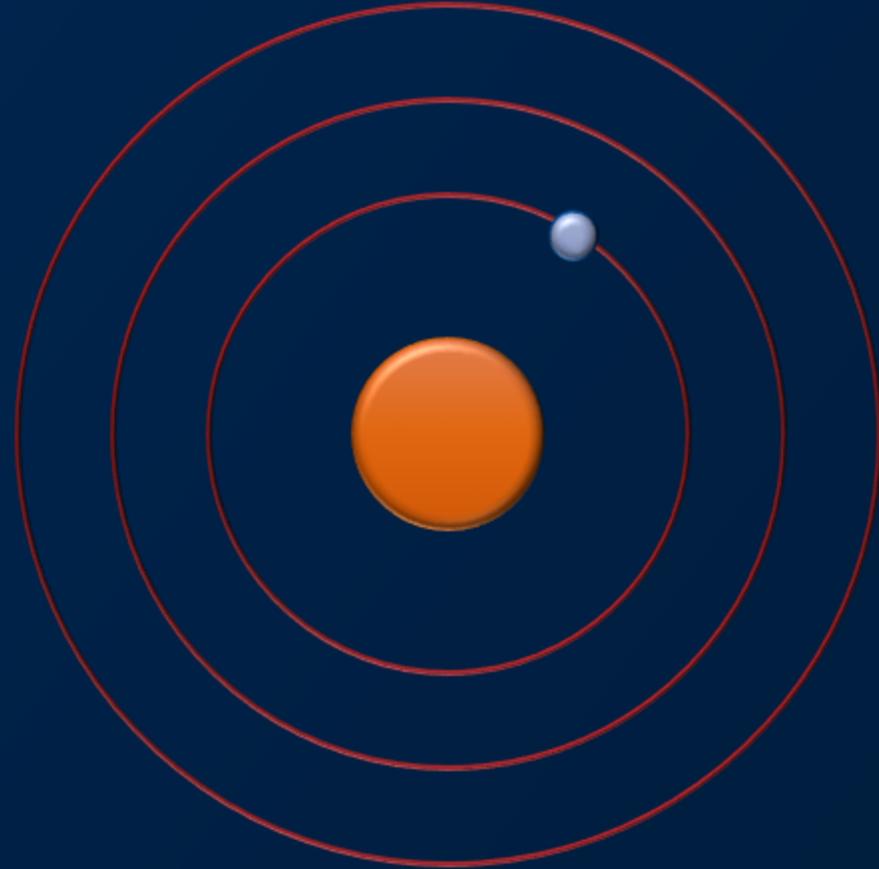

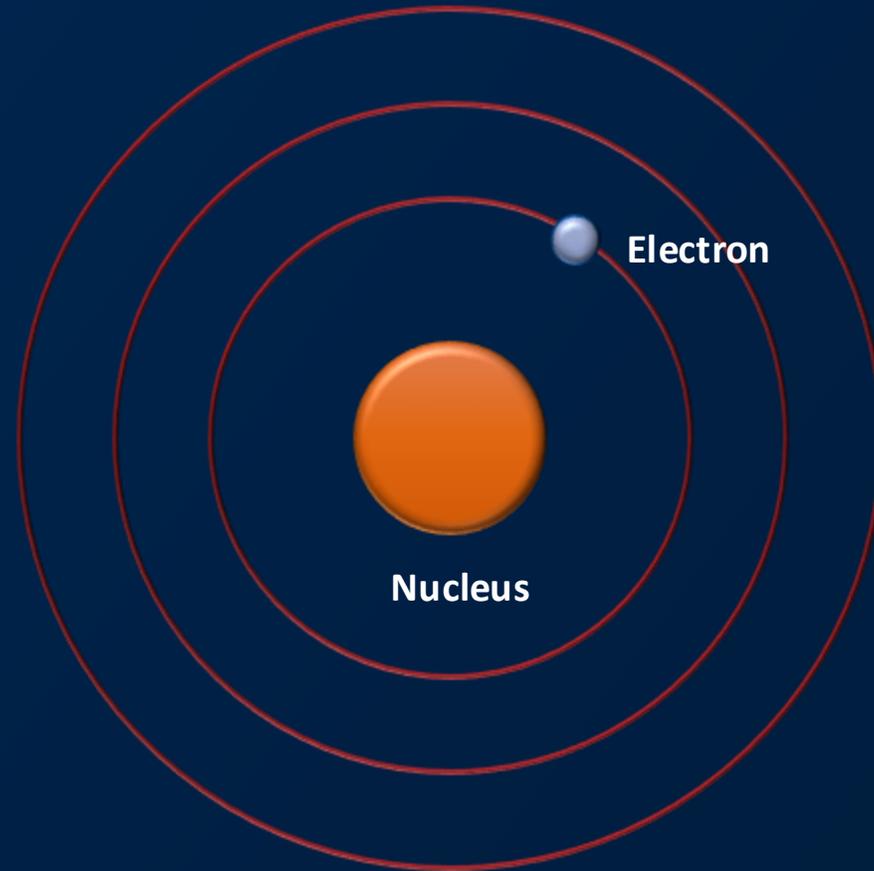

02

Quantum mechanics

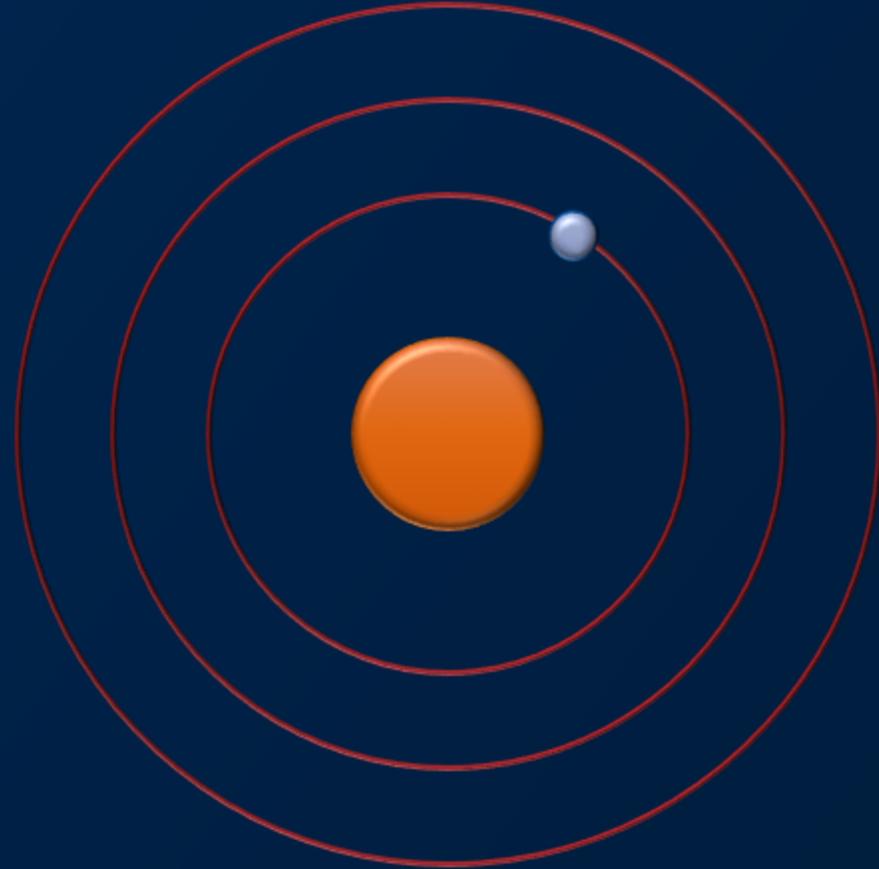

# The atom

# The atom

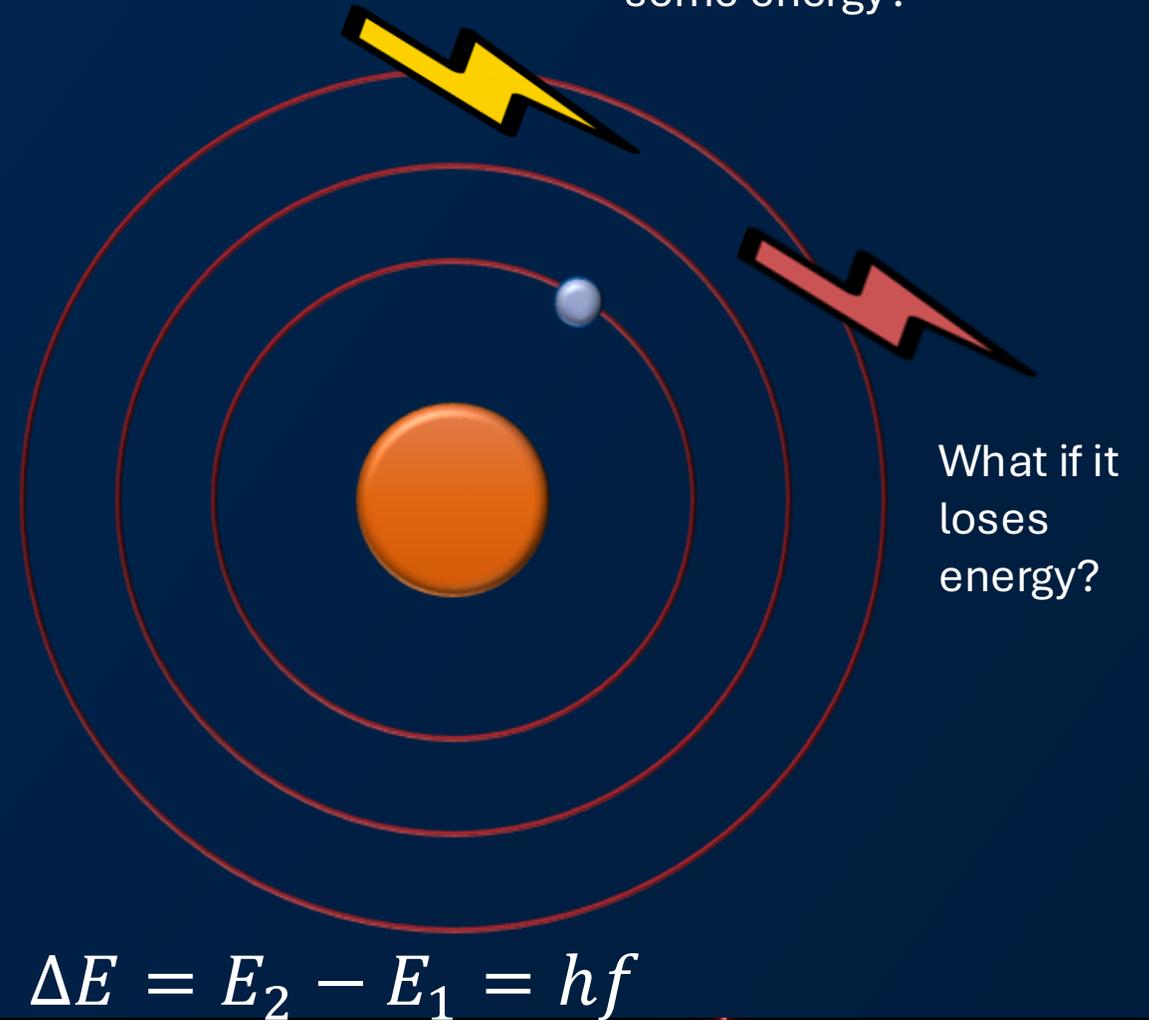

# The atom

# The atom

What happens if the atom is excited with some energy?

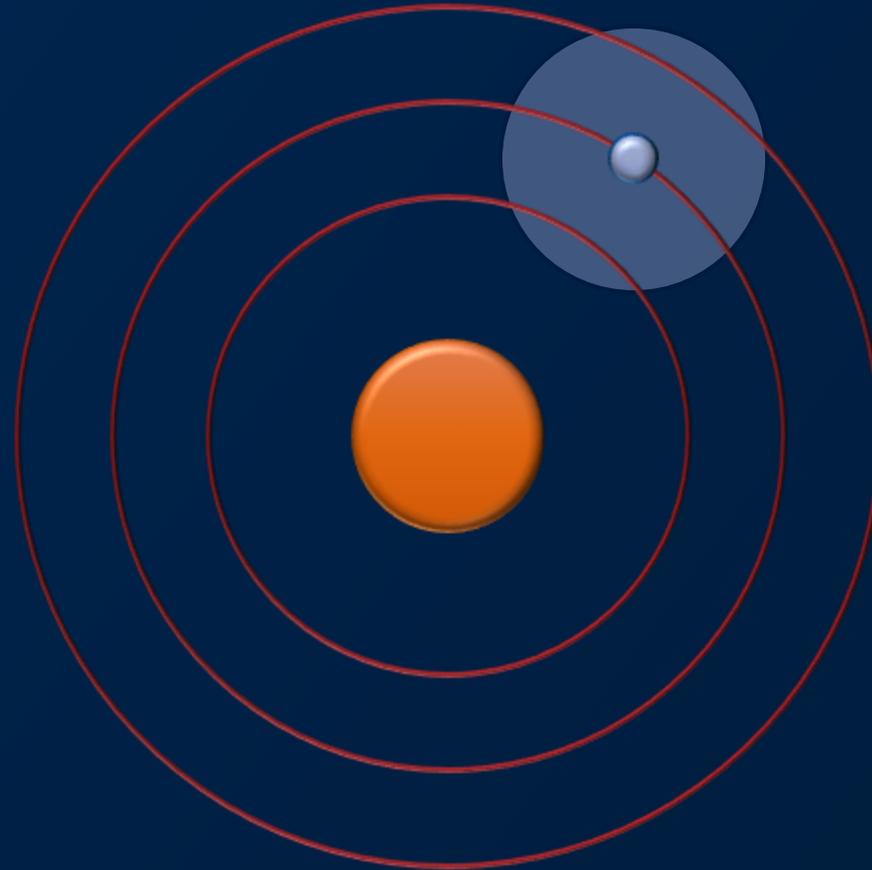

*Energy quanta*

$$\Delta E = E_2 - E_1 = hf$$

What if it loses energy?

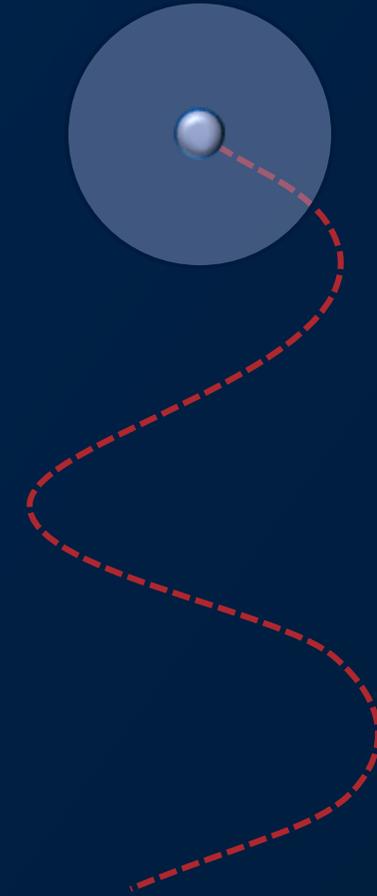

# Heisenberg's Uncertainty Principle

The electron's position is only known with  
some uncertainty

# Heisenberg's Uncertainty Principle

Velocity and position cannot be known at the same time with infinite precision

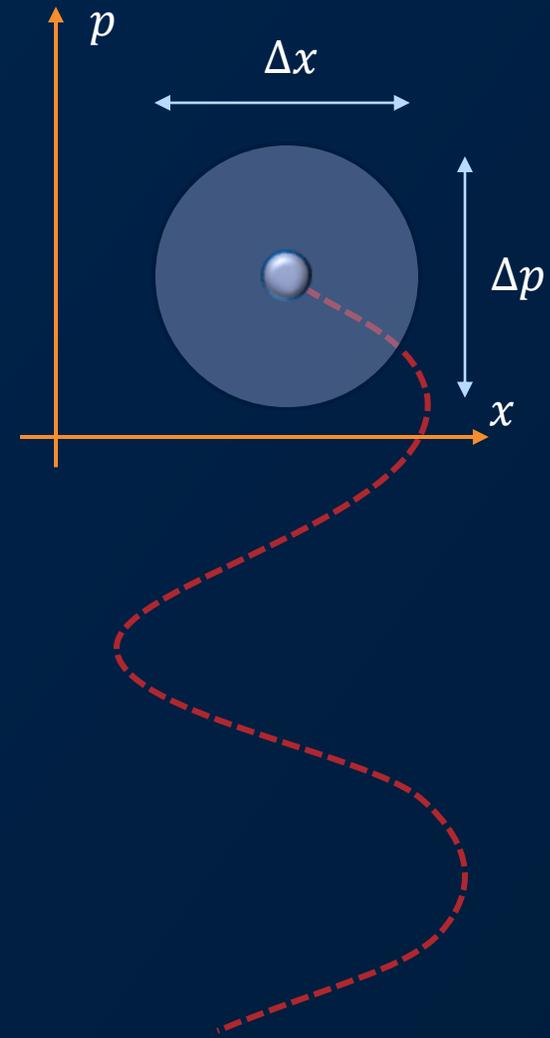

# Heisenberg's Uncertainty Principle

Position

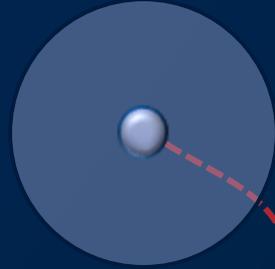

Momentum  
(velocity)

$$\Delta x \Delta p \geq \frac{\hbar}{2}$$

A very small number

# Quantum vs. Classical

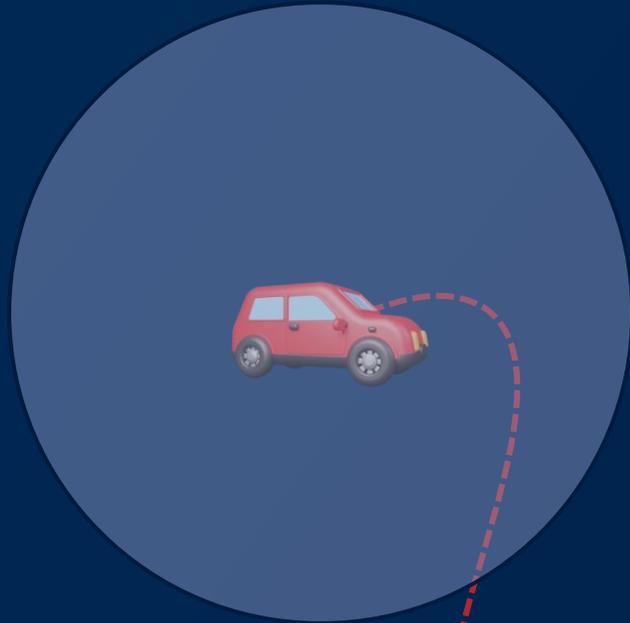

What happens to  
macroscopic objects?

Uncertainty in macroscopic  
systems is infinitesimal.

In our world, classical  
mechanics is still valid!

# Heisenberg's Uncertainty Principle

The uncertainty  
is a very small  
number

What happens to  
macroscopic objects?

## Quantum vs. Classical

A baseball with a mass of 150 g (about 5 ounces) is moving at a velocity of 40 m/s (90 mph).

If the uncertainty in the velocity is 0.1 m/s, the minimum uncertainty in position is?

$\Delta x$  ????

$$\Delta x \geq 3.515 \cdot 10^{-29} m$$

Let's apply the uncertainty principle to a baseball ball

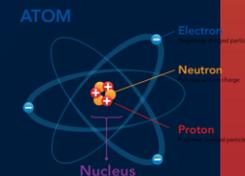

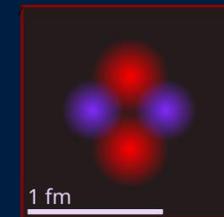

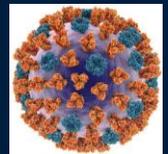

This is:

24 orders of magnitude smaller than a hair

20 orders of magnitude smaller than a virus

19 orders of magnitude smaller than an atom

11 orders of magnitude smaller than an electron

## Quantum vs. Classical

A baseball with a mass of 150 g (about 5 ounces) is moving at a velocity of 40 m/s (90 mph).

If the uncertainty in the velocity is 0.1 m/s, the minimum uncertainty in position is?

$\Delta x$  ???

$$\Delta x \geq 3.515 \cdot 10^{-29} m$$

Let's apply the uncertainty principle to a baseball ball

In our world, classical mechanics is still valid!

## Quantum vs. Classical

A baseball with a mass of 150 g (about 5 ounces) is moving at a velocity of 40 m/s (90 mph).

If the uncertainty in the velocity is 0.1 m/s, the minimum uncertainty in position is?

Let's apply the uncertainty principle to a baseball ball

$$\Delta x \Delta p \geq \frac{\hbar}{2} = \frac{h}{4\pi}: \text{Uncertainty principle}$$

$$h = 6.626 \cdot 10^{-34} \text{ m}^2 \text{ kg/s} : \text{Plank constant}$$

The uncertainty in momentum can be written as:

$$\Delta p = m \Delta v:$$

$\Delta v$  - the uncertainty in velocity

$m$  - the mass of the particle

In your case, you're dealing with a **150-g** baseball that has an uncertainty in velocity of 0.1 m/s, which means that the uncertainty in momentum will be

$$\Delta p = 15 \cdot 10^{-3} \text{ m kg/s}$$

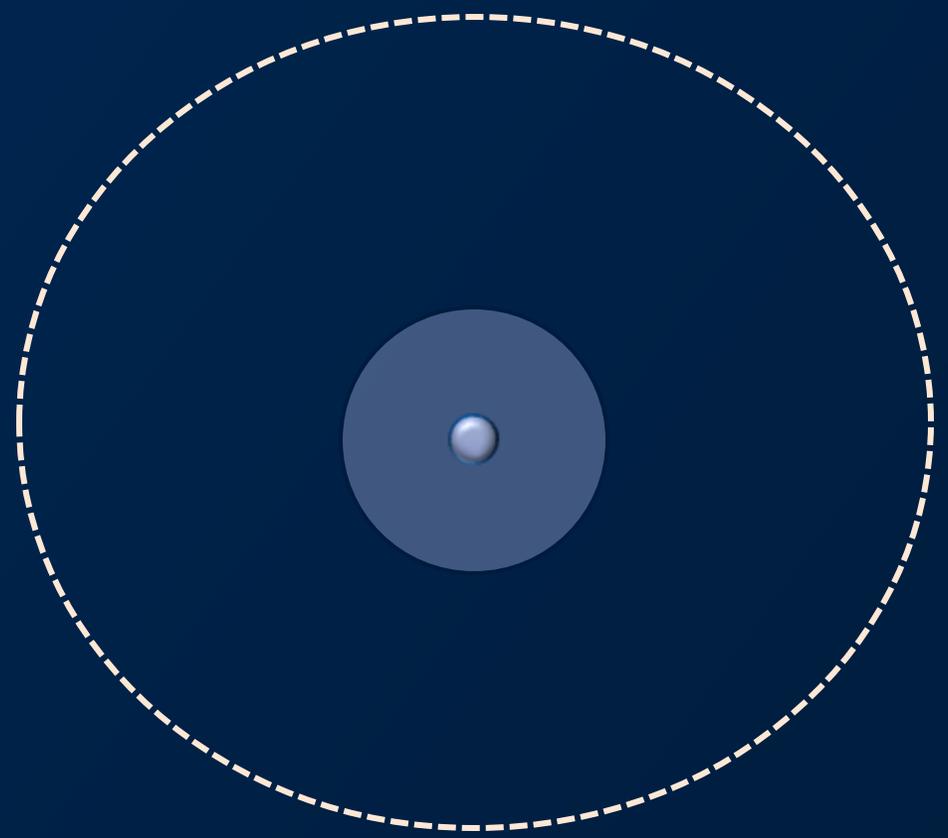

$$\Delta x \geq \frac{h}{4\pi \Delta p}$$

$$\Delta x \geq 3.515 \cdot 10^{-29} \text{ m}$$

## The wave function

*God doesn't play dice*

$$\mathcal{P}(\mathbf{r}, t)dV = |\Psi(\mathbf{r}, t)|^2 dV$$

The physical state of a particle is determined by the probability of being within a certain volume.

03

What makes quantum mechanics spooky

# Superposition

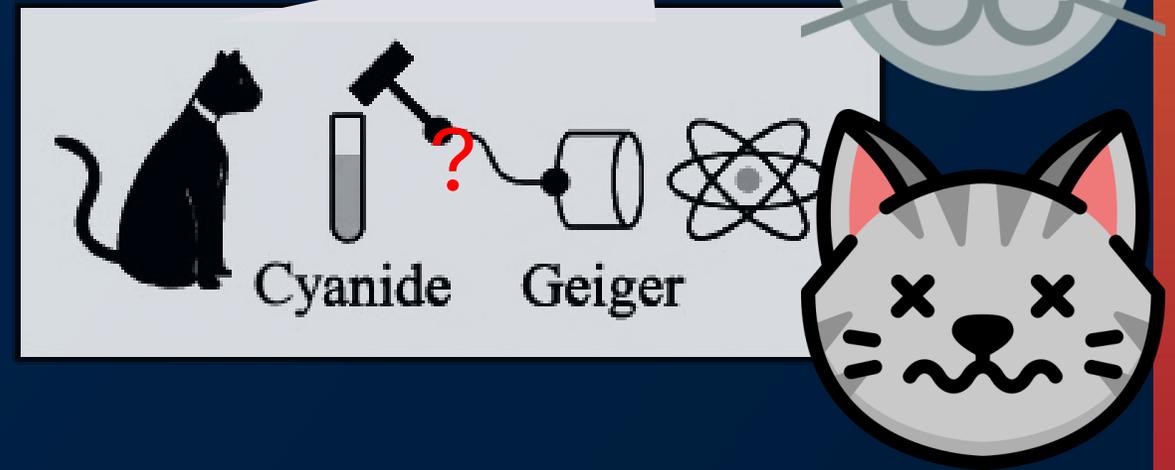

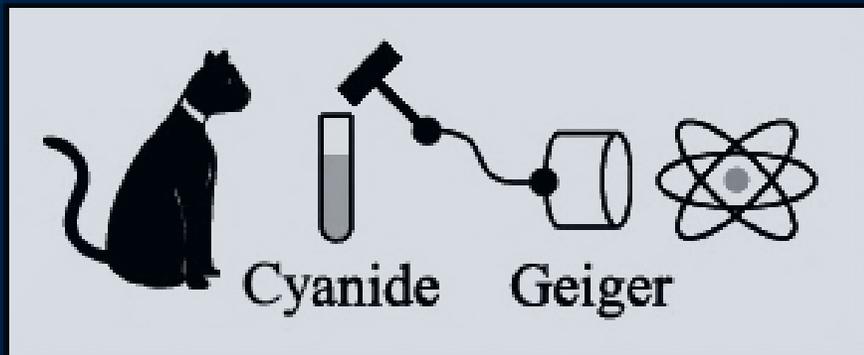

## Schrodinger's cat

**Question:** Is the cat alive or dead?

**Answer:** The cat is in both states →  
**SUPERPOSITION**

**Instrument:** Make a measurement

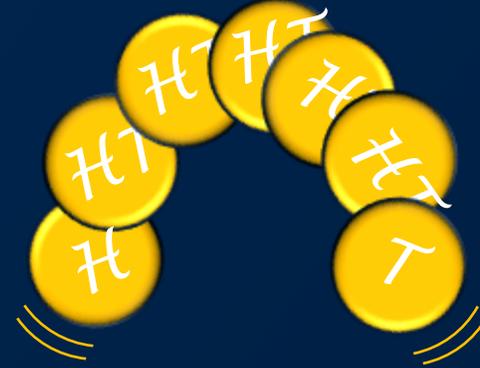

The measurement is: open the lead of the box  
The measurement can trigger or not the  
radioactive mechanism → It alters the  
outcome

# Superposition

When flipping a coin and measuring the result, the outcome is always Heads or Tails. The probability of each state is 50%

In quantum computing, it is possible to create a superposition state with percentages different from 50/50

**What is the probability?**

50/50 HT

**What happens while the coin fluctuates?**

It is in superposition of HT

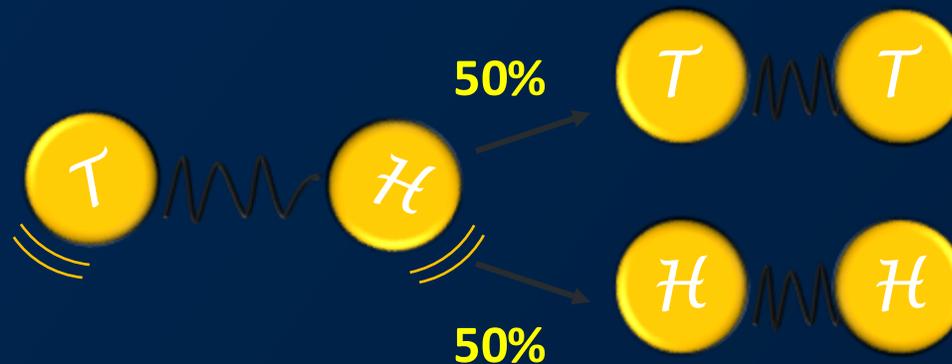

# Superposition

When flipping a coin and measuring the result, the outcome is always Heads or Tails. The probability of each state is 50%

In quantum computing, it is possible to create a superposition state with percentages different from 50/50

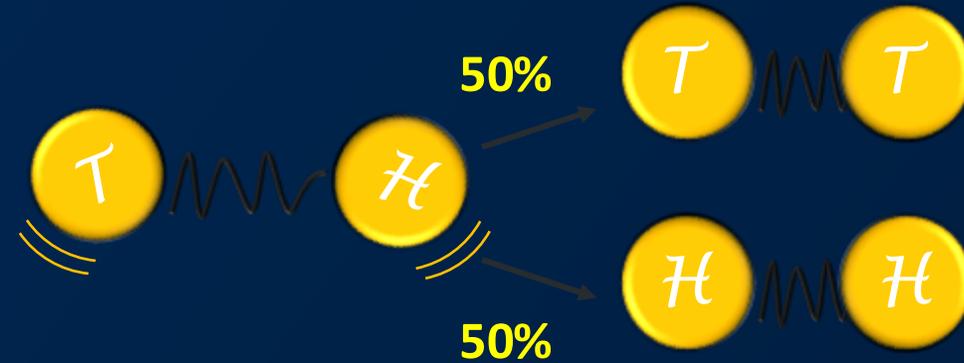

# Quantum Entanglement

T	T	25%
T	H	25%
H	T	25%
H	H	25%

The possible results would be:  
TT, TC, CT, CC (25% probability each).

# Superposition

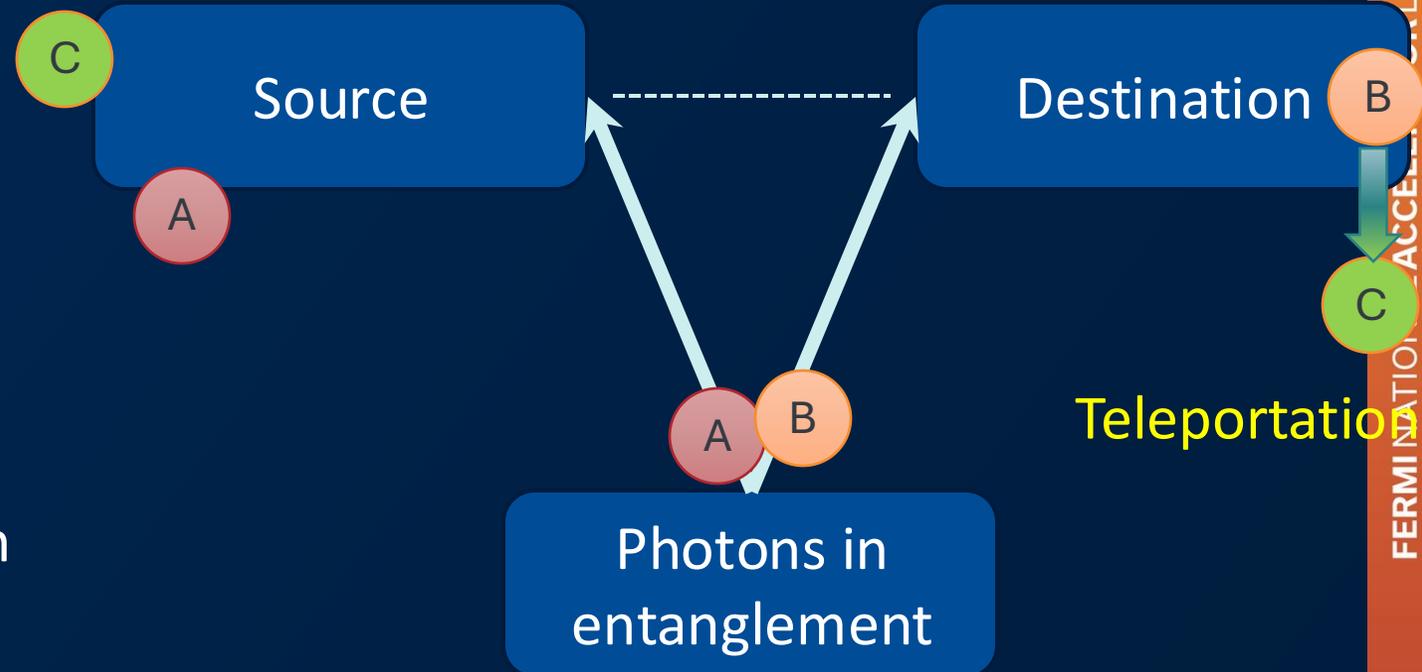

T	T	25%
T	H	25%
H	T	25%
H	H	25%

The possible results would be:  
TT, TC, CT, CC (25% probability each).

**Quantum Entanglement:**  
A correlation is created between the outcomes of the coins.

In quantum computing, if there is an entangled state, the result is 50% TT and 50% CC

# Teleportation

Algorithms for distributing information over secure channels are based on the following:

- Cryptography (prime numbers)
- Teleportation of information

# Teleportation

- The spacecraft Enterprise (Star Trek) was equipped with a transporter.
- Teleportation, in reality, is only possible for quantum information.

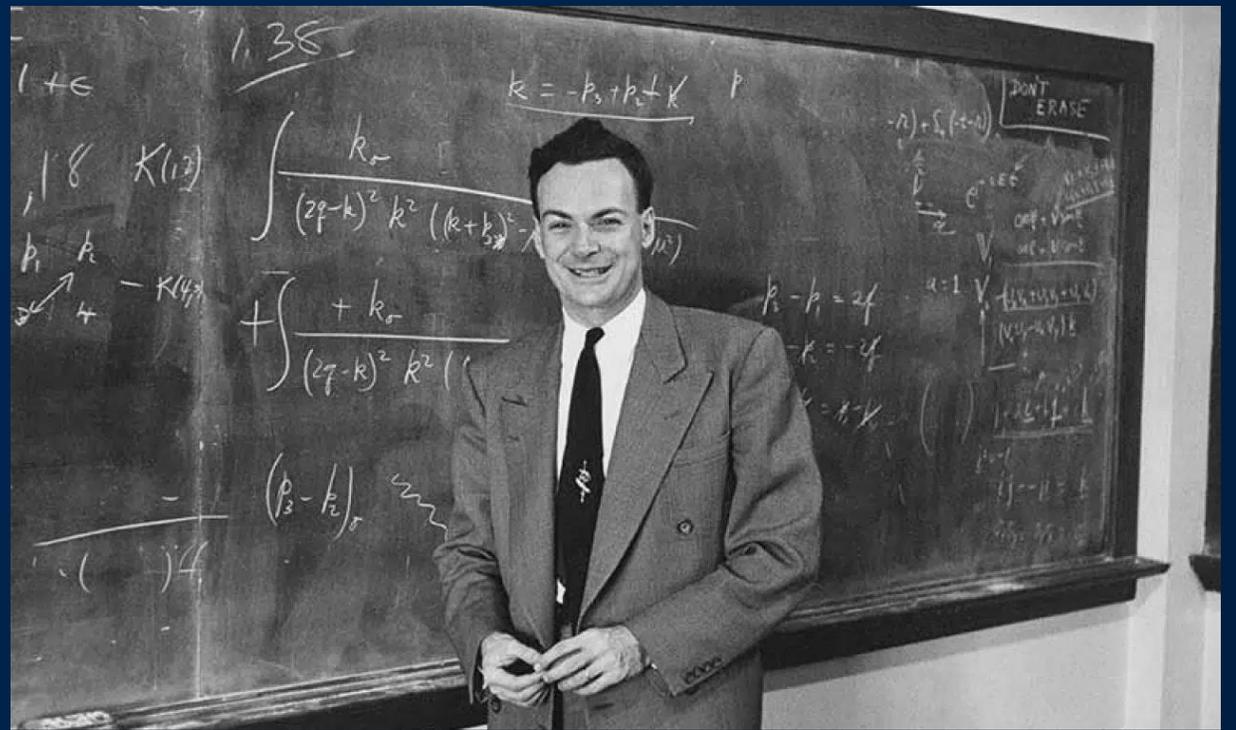

An aerial photograph of the Fermilab campus, featuring a prominent tall, curved tower and several large rectangular buildings. The image is overlaid with a dark blue tint. The number '04' is displayed in white on the left side, with a thin orange horizontal line underneath it.

04

# Quantum computing and applications

# Quantum computers to simulate nature

## Simulating Physics with Computers

**Richard P. Feynman**

*Department of Physics, California Institute of Technology, Pasadena, California 91107*

*Received May 7, 1981*

# Quantum vs. Classical

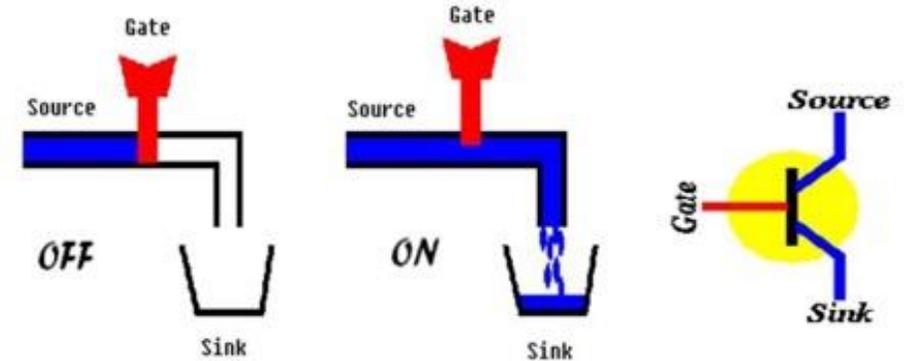

## Transistor

### Logic unit

about 11.8 billions of transistors in a smartphone

- Gate on, Water flow: 1
- Gate off, Water not flow: 0

Classical computing is based on strings of bits

01110101011010101000100011.....0100101

The number bits can be huge, but it will still be truncate

Truncating introduces an errors

# Quantum vs. Classical

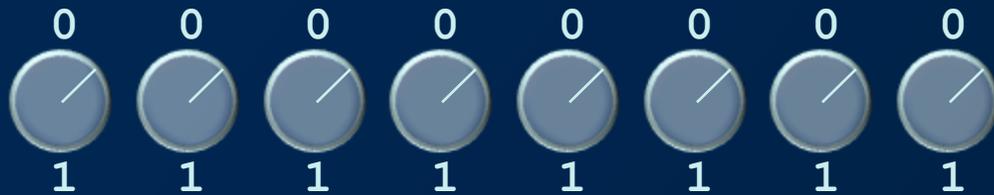

In digital classical systems, truncating introduces an error

Nature is based on an infinite number of states

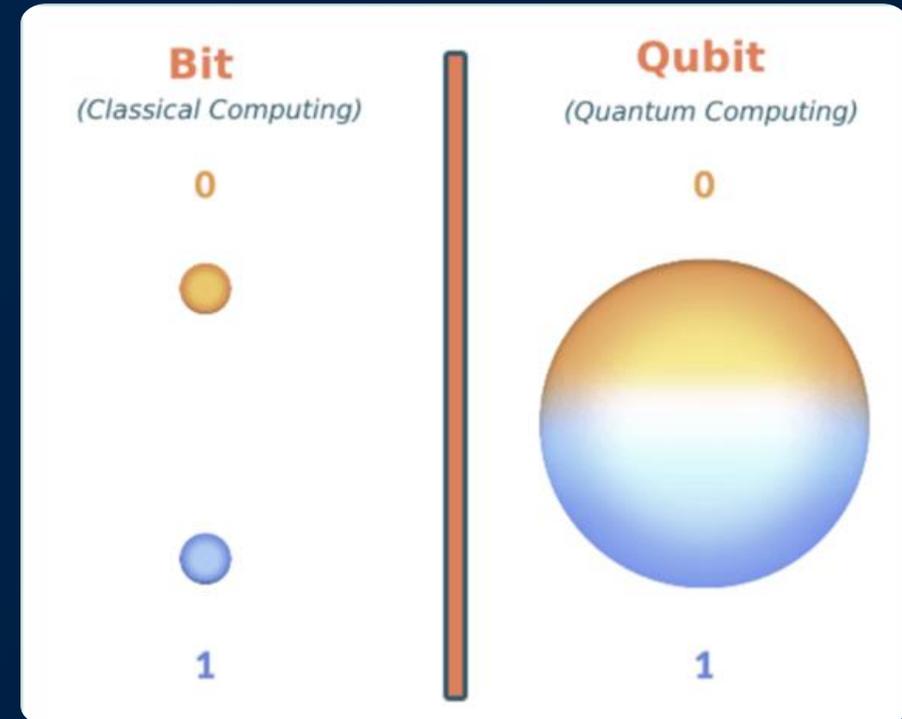

Through quantum computing, it is possible to reduce the error in simulating Nature. This is achieved by leveraging superposition and entanglement.

String of bits

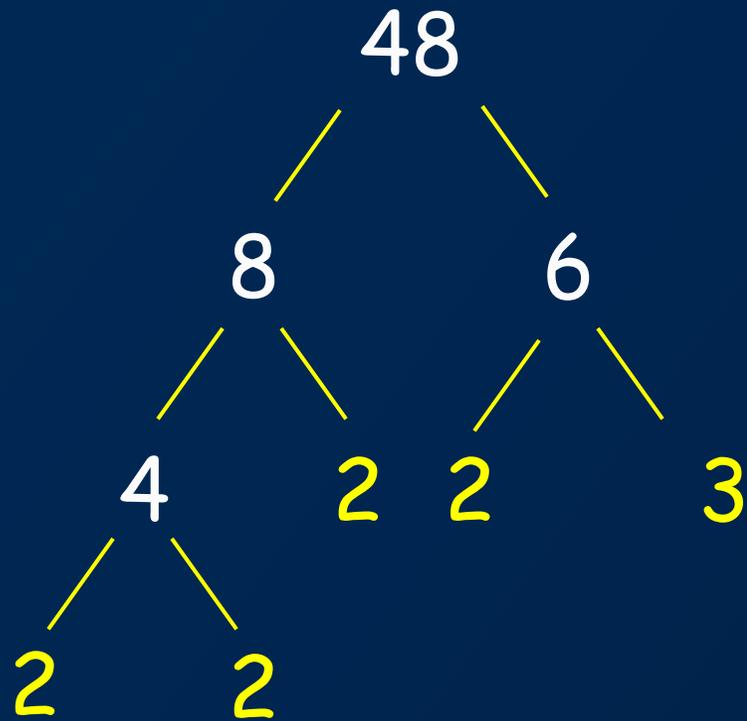

01110101011010101000100011

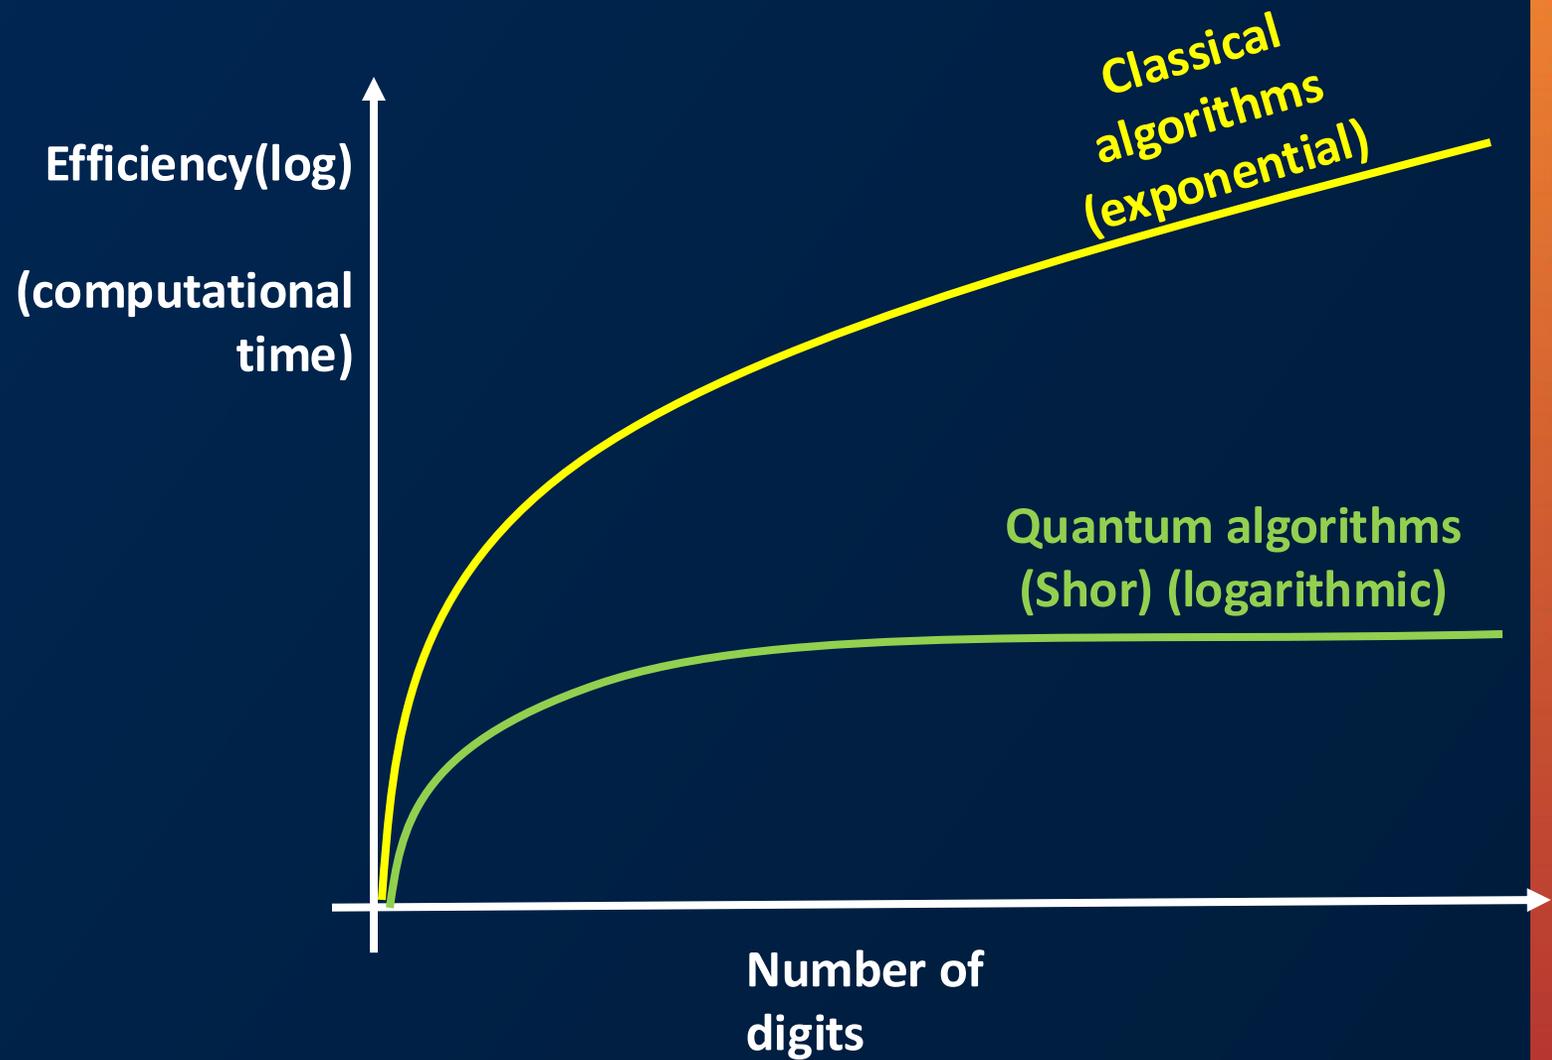

String of QuBit

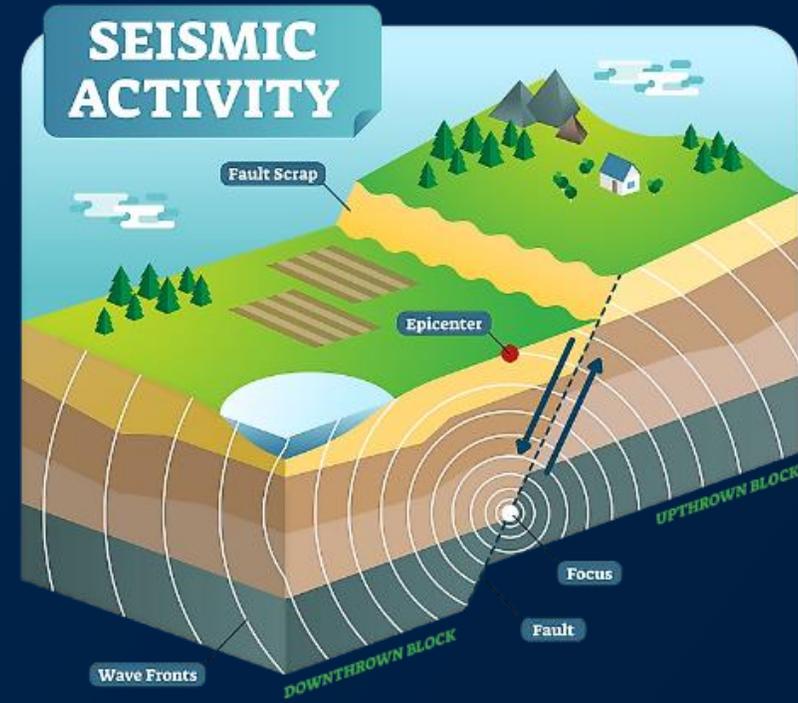

# Prime number factorization

$$48 = 3 \times 2 \times 2 \times 2 \times 2$$

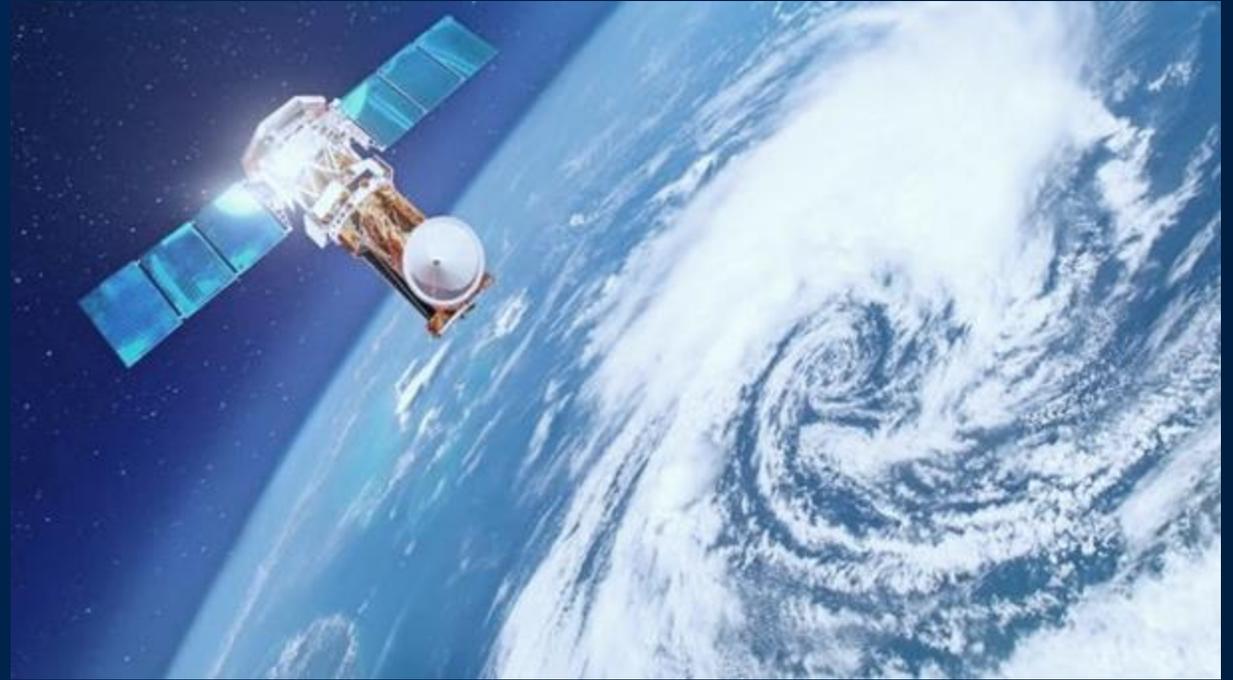

# Quantum computing and sensing

Quantum sensors are used to detect very weak signals, such as those underwater and underground.

**Sensor networks: increase the sensitivity of single sensors through entanglement**

## Quantum computing and sensing

Quantum algorithms can solve very complex models, such as weather forecasting, with very high efficiency and at a reduced time

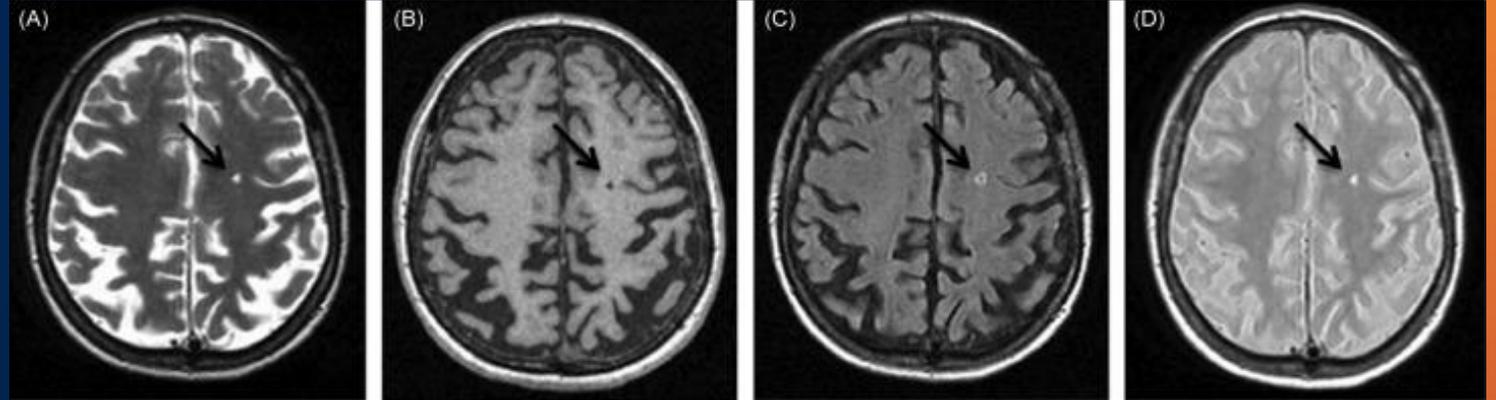

All mathematical models with high number of variables may benefit from quantum computing algorithms

## Quantum computing and sensing

Protein synthesis is an example for which high computational power is needed

# Quantum computing and sensing

**Analysis of biomedical data and imaging, such as Magnetic Resonance signals.**

We are exploring using quantum algorithms to increase the imaging resolution and potentially increase the chances of diagnosis.

# Quantum computing and sensing

Optimizing traffic routes. Pilot programs have been launched in Lisbon and Barcelona

05

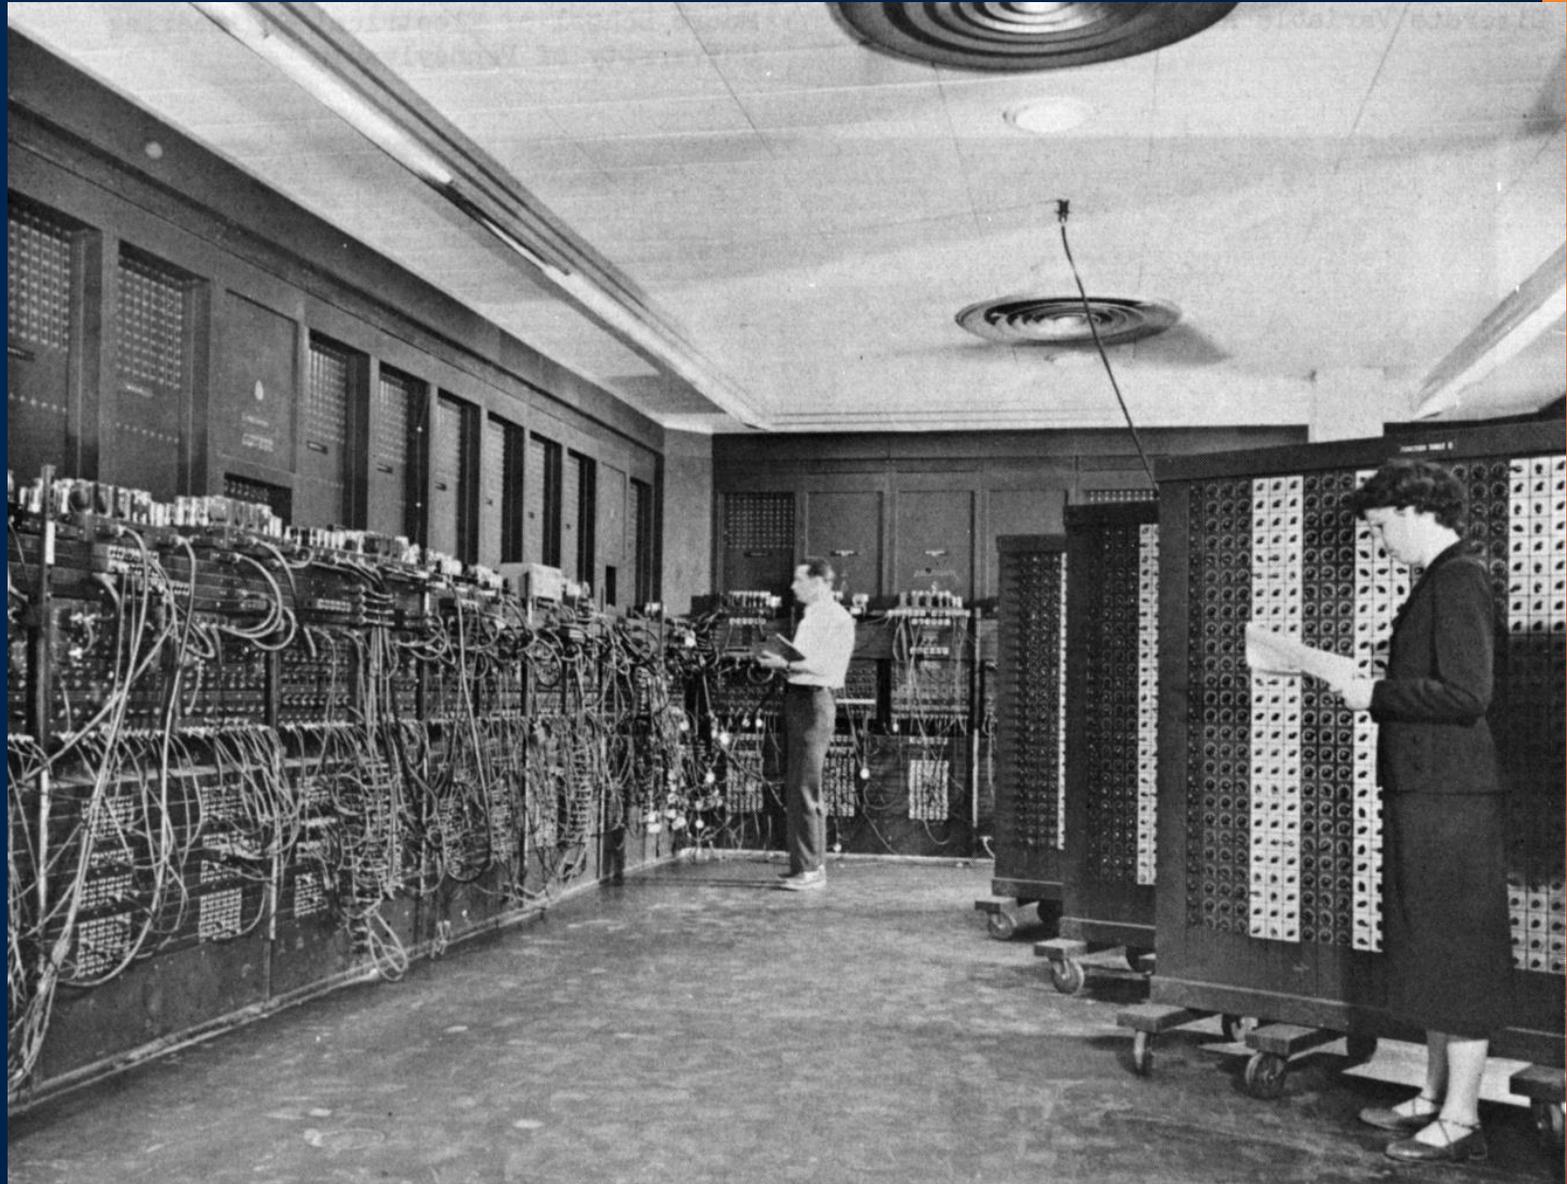

# Hardware platforms

# Classical computers

ENIAC filled a 20 by 40-foot room, weighed 30 tons, and used more than 18,000 vacuum tubes.

Transistor

# Fermilab and the SQMS Quantum Center

# Fermilab

- America's particle physics and accelerator laboratory
- Operates the largest US particle accelerator complex
- ~1,900 staff and ~\$600M/year budget
- 6,800 acres of federal land
- Facilities used by 4,000 scientists from >50 countries

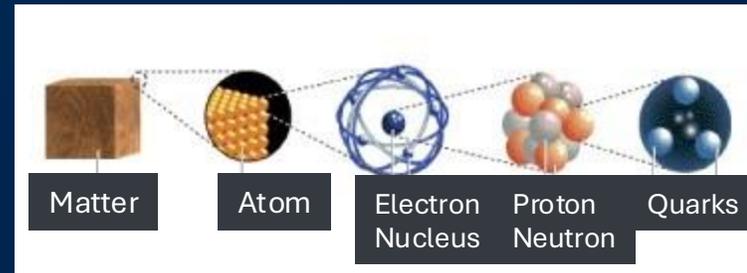

As we move into the next 50 years, our vision remains to solve the mysteries of matter, energy, space, and time for the benefit of all.

## What is an accelerator

- It is big **microscope** used to study the smallest particles that make up the matter

- Study the origin of the universe

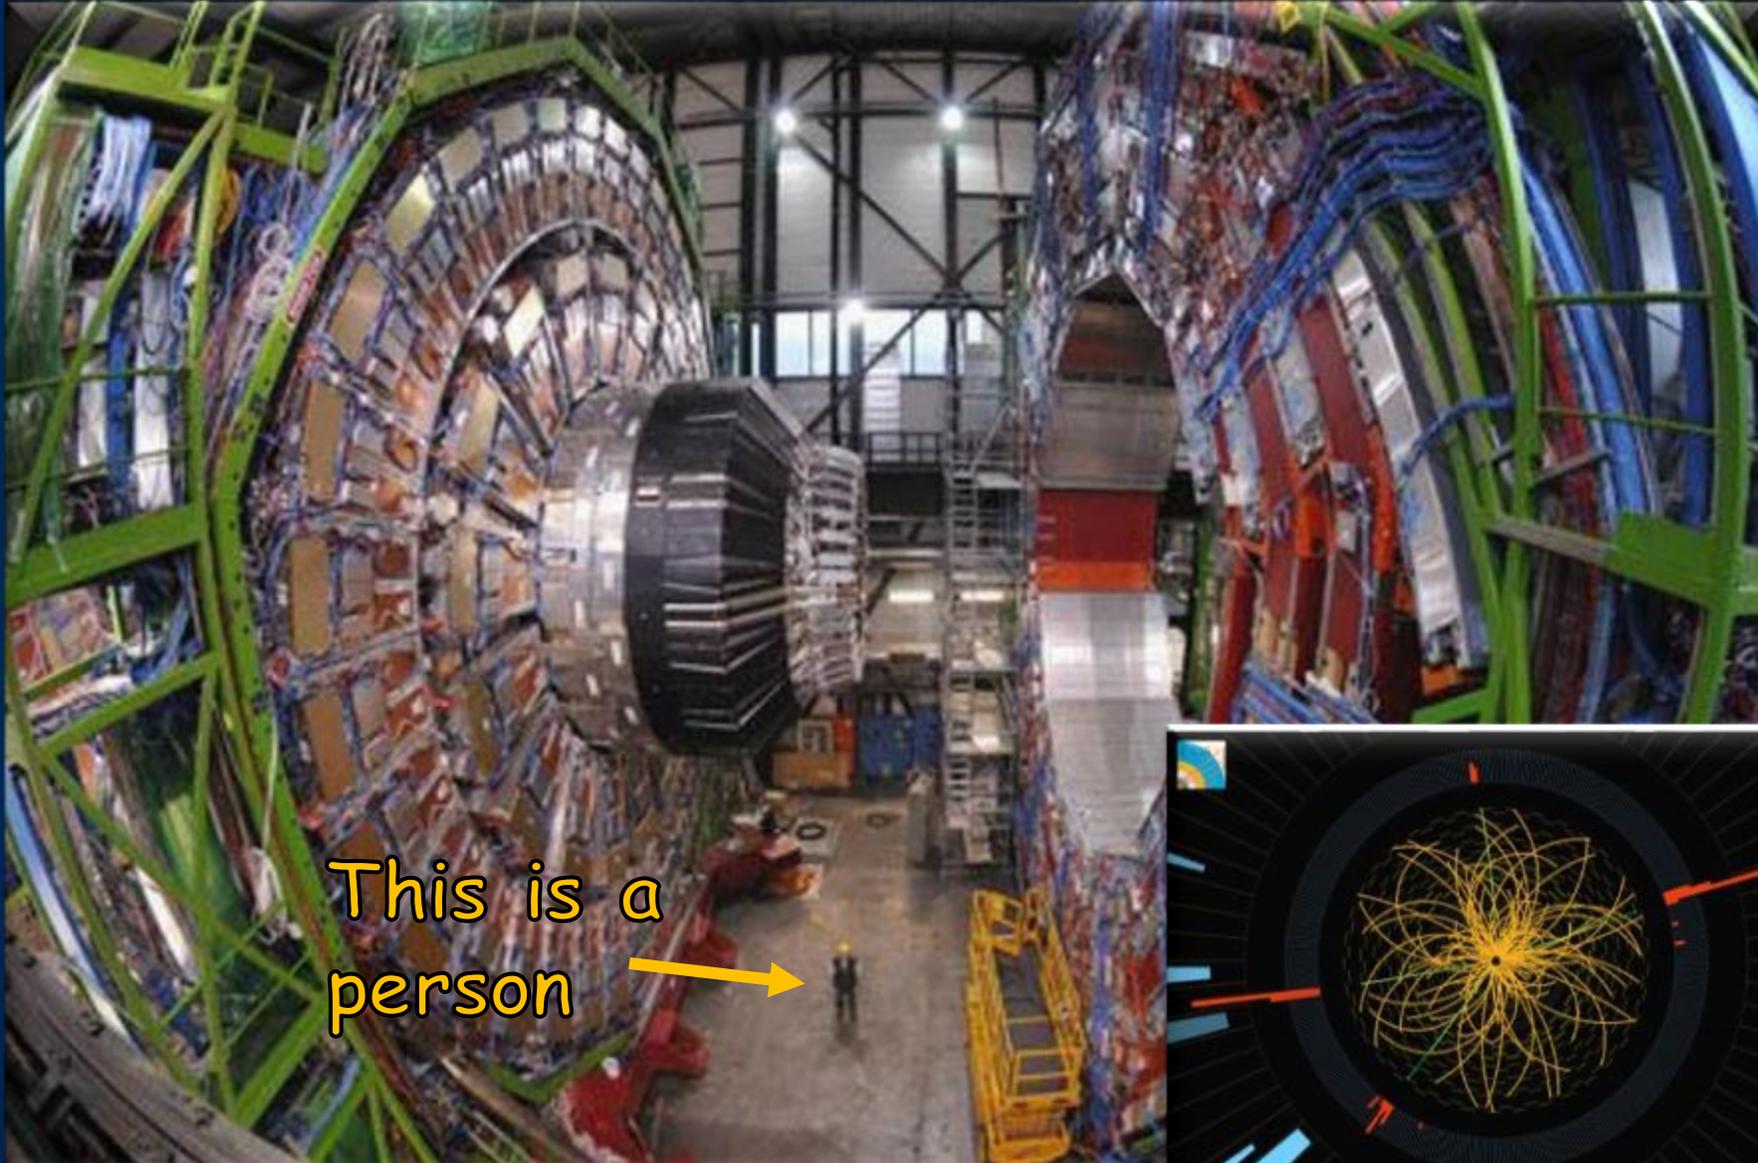

# Big Bang

A first collision from which everything started

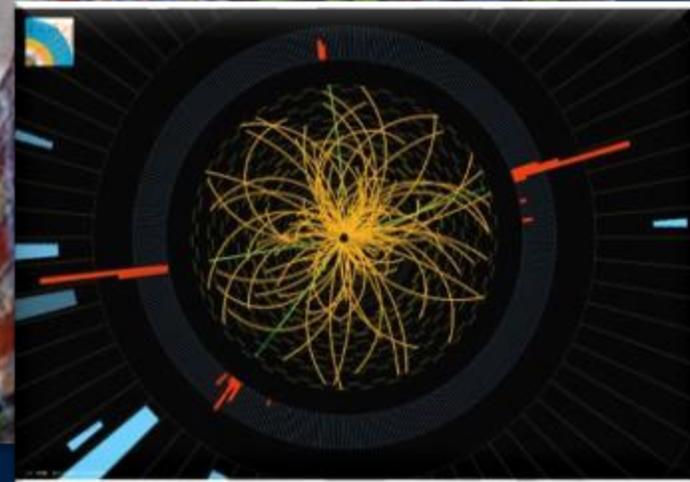

# Speed of Light

# Understanding the size of an experiment – CMS (CERN)

PROTON  
ACCELERATOR

## Origin of Matter

- Could neutrinos be the reason that the universe is made of matter rather than antimatter? By exploring the phenomenon of neutrino oscillations, DUNE seeks to revolutionize our understanding of neutrinos and their role in the universe.

# Quantum computing and sensing at Fermilab

## HEP for QIS

Technology expertise and infrastructure for the development of new quantum devices and for the challenges of scaling up quantum systems

## QIS for HEP

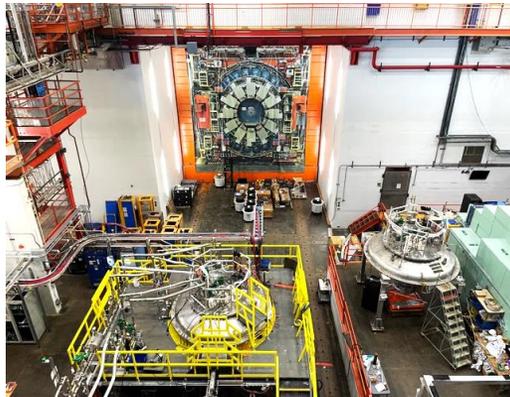

Tackle HEP challenges, such as dark matter detection, quantum computing advantage for field simulations

Superconducting technology

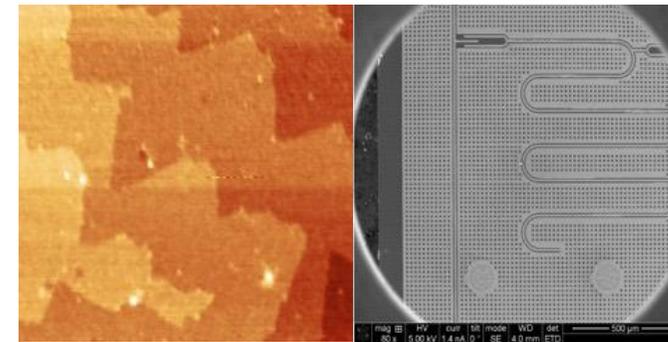

SRF cavities with long coherence time

Cryogenics

Control electronics

Materials and devices

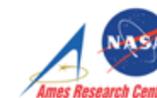

## A DOE National QIS Research Center

**36**

Partner Institutions

**550+**

Collaborators

SQMS brings together hundreds of experts from more than 30 DOE national labs, academia, industry and other federal and international entities to bring transformational advances in QIS

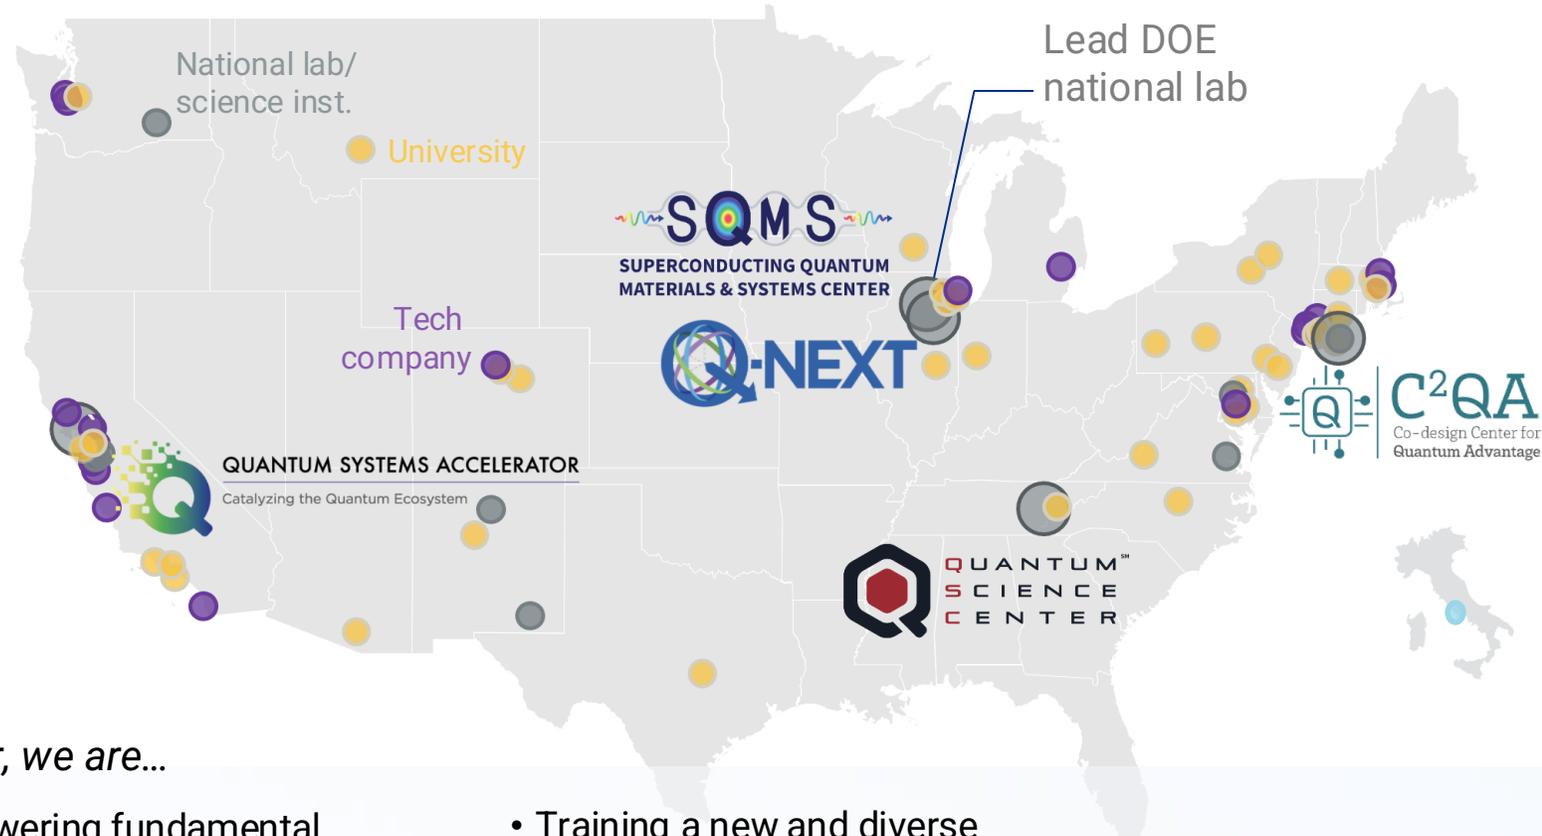

# The DOE National QIS Research Centers

Unique institutional partnerships boost joint efforts in academia, industry and national labs

**1,200+** experts

**600+** students  
& postdocs

at **80** institutions in  
in **21** US states & DC

DOE NQISR Centers leverage unique capabilities, expertise and facilities to achieve bold scientific and technological goals.

*Together, we are...*

- Answering fundamental open questions in QIS
- Training a new and diverse quantum workforce
- Accelerating scale-up
- Leveraging DOE user facilities for advanced materials analysis and device fabrication
- Fostering technology transfer – rapid cycle from discovery to commercialization
- Developing national standards

# Quantum computing and sensing at Fermilab

## HEP for QIS

Technology expertise and infrastructure for the development of new quantum devices and for the challenges of scaling up quantum systems

## QIS for HEP

Superconducting technology

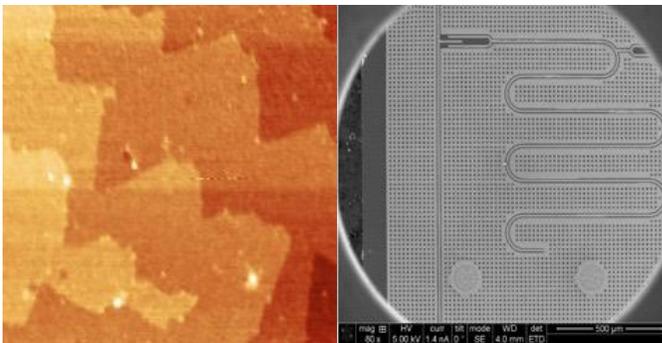

SRF cavities with long coherence time

Cryogenics

Control electronics

Materials and devices

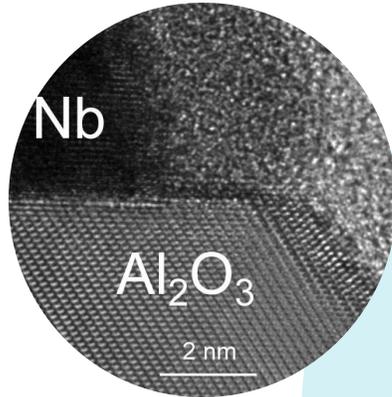

# SQMS 1.0: Building on Fermilab's unique accelerator expertise and facilities to advance Quantum Information Science

## Abate decoherence sources

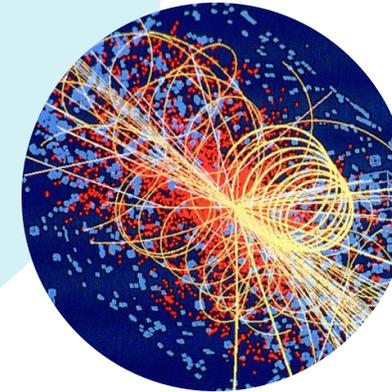

Fundamental science of materials and nanostructures to advance superconducting device performance

## High coherence cavity systems

Record coherence microwave cavity devices and quantum interconnects for high fidelity scaling of quantum computers and sensors

**SQMS Mission:**  
to bring transformational advances in development and deployment of high coherence superconducting quantum systems.

## Efficient cryogenic scaling

Large scale low temperature cryogenic technology, distribution systems for scaling efficiently to large quantum systems

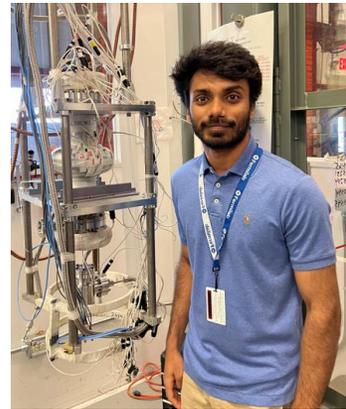

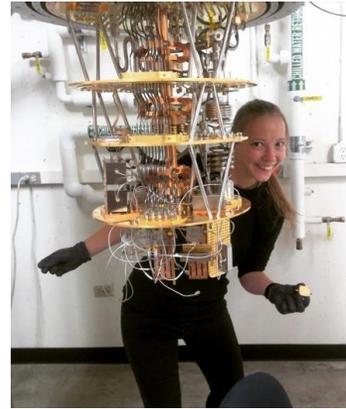

## Simulation and sensing

Theory and simulation to solve high energy and condensed matter physics problems on quantum platforms

*SQMS brings decades of DOE investments in accelerator facilities and technologies in a **government-industry-academia** strategic partnership framework for broad impacts*

# Training through research

- Expose interns to cutting-edge facilities and expertise in a multi-institutional/multi-disciplinary collaboration.
- Research projects under the direct supervision of SQMS PIs.
- Develop and practice research, technical, and soft skills (presentations, networking, etc.).
- Interns participate in weekly meetings with SQMS researchers, with progress reports every 3 weeks, a final presentation during the SQMS meeting, and a report on research activities.
